```
; OurScheme Intro. (modified from MIT Scheme) (version: 2011-05-11)
; Meaning vs. representation --- on the abstract level
; We communicate with each other. We communicate with the system.
; When we communicate, we have no choice but to use some
  symbolic expression to convey our meaning (the "things"
  that we mean).
; Each symbolic expression (if legal) ought to mean something.
; Each symbolic expression (if legal) has a MEANING.
; We use symbolic expressions to convey our meaning.
; The system understands our meaning.
; Sometimes, the system is asked (by us) to do what we mean.
; When the system has a result to show to us, it has no choice
; but to show a symbolic representation of it. Supposedly,
; we know what the expression (what the system shows) means.
; 1. A list (or a dotted pair) is CONSTRUCTED.
> (cons 3 4) ; an operation on two objects
(3.4)
                ; a representation of the resulting object
> (CONS 3 4)
ERROR (unbound symbol) : CONS
; When evaluating an S-exp, Scheme/Lisp treats the first token
; after '(' as a function call
; 'cons' is a shorthand for "construct";
; implementation aspect : a {\tt CONS-cell} is created
; OurScheme distinguishes between upper and lower cases
; // However, Petite Scheme does not.
> (list 3 4)
               ; another operation on two objects
              ; a representation of the resulting object
(34)
; Notice the difference between (3 . 4) and (3 . 4)
; 2. To "by pass" the default interpretation of an S-exp
  by the system, use QUOTE.
> (3 4 5)
The object 3 is not applicable ; // or "Invalid function: 3"
> '(3 4 5)
(3 \ 4 \ 5)
> (quote (3 4 5))
(3 \ 4 \ 5)
> (cons 3 (4 5))

        (+ x y)
         (* x y)
h defined
> (g 3 5)
120
> (h 3 5)
15
```

```
; 7. Primitive predicates (A predicate is a function that returns
     "true" or "false"; By convention, the name of a predicate should have a suffix '?')
              ; Other Lisps do not have PAIR
> (pair? 3)
               ; They have ATOM, which returns the opposite
nil
               ; logical value
               ; e.g.,
               ; > (atom 3)
               ; #t
> (pair? '(3 4))
#t ; > (atom '(3 4))
              ; nil
> (pair? '(3 . 4))
> (pair? "Hello, there!")
> (null? '()) ; is it the empty list?
            ; yes
> (null? #f)
> (null? '(3 . 4))
nil ; no, it is not the empty list
> (integer? 3)
> (integer? 3.4)
nil
> (real? 3)
nil
> (real? 3.4)
> (number? 3)
#t
> (number? 3.4)
> (string? "Hi")
#t
> (string? 3.4)
> (boolean? #t)
> (boolean? '())
> (boolean? #f)
> (boolean? '(3 . 4))
nil
```

```
> (symbol? 'abc)
#t
> (symbol? 3)
nil
; 8. Basic arithmetic, logical and string operations
> (+ 3 7)
10
> (- 3 7)
-4
> (- 3.2 5)
-1.7999999999999998
> (* 3 4)
> (define a 5)
a defined
> (/ 15 a)
> (/ 15.1 4)
3.775
> (/ 15.1 (+ 2 2))
3.775
> (not #t)
nil
> (not (pair? 3))
#t
> (and (pair? 3) (null? '()) )
> (or (pair? 3) (null? '()) )
> (> 3 2)
#t
> (> 3.1 2)
> (>= 3.2 2)
> (< 3.1 2)
()
> (<= 3.1 2)
nil
> (= 2 2)
#t
> (string-append "Hello," " there!")
```

```
"Hello, there!"
> (string>? "abc" "abc")
; 9. eqv? and equal?
; eqv? returns "true" only when the two being compared
; objects are atoms (except in the case of strings)
; or when the two being compared objects "occupy the
; same memory space".
1. The two arguments of 'eqv?' OUGHT TO BE evaluated first.
2. Let the evaluated result of the first argument be \bigstar.
  Let the evaluated result of the second argument be \stackrel{\star}{\upplus}.
3. 'eqv?' returns '#t' if
    \bigstar \updownarrow are the same atom (except in the case of strings)
    \bigstar \updownarrow (including the case of strings) occupy the same memory space
4. 'eqv?' returns 'nil' otherwise.
Example :
> (eqv? a a)
ERROR (unbound symbol) : a
> (define a '(1 3))
a defined
> (eqv? a a)
#t
> (define b a)
b defined
> (eqv? a b)
> (eqv? '(1 3) '(1 3))
nil
> (eqv? a (car (cons a '(2 3))))
> (eqv? "Hello, there" "Hello, there")
nil
> (define a "Hello, there")
a defined
> (eqv? a "Hello, there")
nil
> (eqv? a (car (cons a '(2 3))))
> (define a 1)
a defined
> a
1
```

```
> (eqv? a 1)
> (eqv? "Hi" "Hi")
nil
> (define a 'a)
a defined
> a
> (eqv? a 'a)
> (define b 'a)
b defined
> (eqv? a b)
> (define a 'abc)
a defined
> (define b 'abc)
b defined
> (eqv? a b)
#t
> (eqv? a 'abc)
; equal? corresponds the usual notion of
; equality comparison
> (equal? a a)
> (equal? '(3 4) '(3 4))
> (equal? "Hi" "Hi")
; 10. Conditionals
> (if (> 3 2) 'good 'bad)
good
> (if a 'good 'bad)
good
> (if (not a) 'good 'bad)
bad
> (cond ((> 3 4) 'bad)
        ((> 4 3) 'good)
        (else "What happened?") ; even though 'else' is unbound
 )
good
> (cond ((> 3 4) 'bad)
       ((> 4 5) 'bad)
```

```
(#t "What happened?")
"What happened?"
> (define else #t)
else defined
> (cond ((> 3 4) 'bad)
      ((> 4 5) 'bad)
       (else "What happened?")
"What happened?"
> (cond ((> 3 4) 'bad)
      ((> 4 5) 'bad)
ERROR (no return result) : cond
> (cond ((> 3 4) 'bad)
      ((> 4 3) 'good)
good
; 11. Sequencing vs. functional composition
> (define (f x y) (+ (* x y) x) )
f defined
> (f 3 5)
18
> (define d 20)
d defined
> (define (g x y) (define d (* x y)) (+ d x) )

> (g 3 5)
18
> d
> (if #t 3 5)
3
> (if #t (begin 3 4 5) (begin 6 7))
> (if #t (3 4 5) (6 7))
ERROR (attempt to apply non-function) : 3
> (cond ((> 5 3) 'good 'better 'best) (#t 'OK?) )
best
; Remember! A function must always RETURN something.
; And that "value of the 'function application' " is what
; the (Lisp) system is trying to obtain.
```

```
; 12. Meaning of DEFINE revisited ("令")
; Basically, DEFINE sets up a (temporary) binding between a symbol
; and an S-expression
; However, when a "lambda expression" is evaluated, a "compiled
; function" is created internally, and the "returned value" is ...
> (lambda (x) (+ x 5) ) ; a function is described; it has no name.
#function
; DEFINE sets up the binding between a name and (in the case of
; lambda expressions) the internal definition of a function
> (define f (lambda (x) (+ x 5)) )
f defined
> (f 3)
> ((lambda (x) (+ x 5)) 3)
> (define g '(lambda (x) (+ x 5)) )
g defined
> (g 3)
The object (lambda (x) (+ x 5)) is not applicable.
; 13. Local variables
; Use LET to create (local) symbol bindings ("令")
> (let ( (x 5)
         (foo (lambda (y) (bar x y)))
         (bar (lambda (a b) (+ (* a b) a)))
      (foo (+ x 3))
 )
45
> (define (f z)
  (let (x 5)
         (foo (lambda (y) (bar x y)))
         (bar (lambda (a b) (+ (* a b) a)))
       (+ (foo (+ x 3))
         z)
  ))
f defined
> (f 7)
52
> (foo 2)
ERROR (unbound symbol) : foo
> (let ((x 5) (y 6) (z 7)
        (foo (lambda (y) (bar x y)))
        ( bar (lambda (a b) (+ (* a b) a)))
      (+ (foo (+ x 3)) y z)
 )
58
```

```
; 14. Change of (local) symbol bindings ("assignment")
; Assignments are of the form 'set...!'
; e.g.,
; set! set-car! set-cdr!
> (set! w 7)
> w
> (define a '(3 4))
a defined
> (define b a)
b defined
> (set-car! a 5)
